AMENDMENT TO THE CLAIMS

- 1. (Currently Amended) A process analytic system comprising:
 - a device for sensing a concentration of a combustible species of interest in an exhaust stream;
 - a controller coupled to the device and configured to receive measurements of the concentration of the combustible species; and
 - a blowback system coupled to the device and the controller, the blowback system being configured to responsively reverse gas flow through the device;

wherein the device comprises:

- a holder:
- a first RTD disposed in a first protective cover, wherein the first cover is metallic and is mounted to the holder and separates the first RTD from the exhaust stream;
- a second RTD disposed in a second protective cover, wherein the second cover is metallic and is mounted to the holder and separates the second RTD from the exhaust stream; and
- wherein the first cover comprises a catalyst thereon which has a higher catalytic activity to the species of interest than the second cover; and
- wherein each of the first and second RTD's are thermally coupled to its respective protective cover by a thermoconductive material.
- 2. (Original) The device of claim 1 wherein the first cover is formed from a tube.
- 3. (Original) The device of claim 1 wherein the second cover is formed as a tube.

- 4. (Previously Presented) The device of claim 1 wherein the catalyst is disposed on the first cover as a film.
- 5. (Previously Presented) The device of claim 4 wherein the film is a Group VIII noble metal catalyst.
- 6. (Previously Presented) The device of claim $\underline{4}$ wherein the film is constructed from a metal oxide combustion catalyst.

7. (Canceled)

- 8. (Previously Presented) The device of claim 1 wherein the catalyst comprises perovskite.
- 9. (Previously Presented) The device of claim 1 wherein the catalyst comprises hopcalite.
- 10. (Original) The device of claim 1 wherein the second cover is constructed from a catalyst-free stainless steel tube.
- 11. (Original) The device of claim 1 wherein at least one of the first and second cover is joined to the holder using thermally insulative material.
- 12. (Original) The device of claim 11 wherein the thermally insulative material is selected from the group of ceramic cement, adhesive, and high-temperature epoxy.

13. (Canceled)

14. (Canceled)

- 15. (Canceled)
- 16. (Canceled)
- 17. (Canceled)
- 18. (Canceled)
- 19. (Canceled)
- 20. (Canceled)
- 21. (Canceled)
- 22. (Canceled)
- 23. (Currently amended) A solid state device for determining the concentration of oxygen in a gas phase,

the solid state device comprising:

- a solid electrolyte;
- a reference electrode coupled to <u>a surface of</u> the solid electrolyte and being exposed to a gas with a known partial pressure of oxygen; and
- a working electrode including a mixed ion/electron conductor chosen from the ceria-containing flourite group of materials, wherein the working electrode is coupled to the same surface of the solid electrolyte as the reference electrode.
- 24. (Original) The device of claim 23 wherein the solid electrolyte is selected from the group consisting of doped zirconia and ceria.

- 25. (Original) The device of claim 23 wherein the reference electrode is constructed from the group consisting of platinum, a metal oxide electrode, and a mixed conducting electrode.
- 26. (Original) The device of claim 25 wherein the metal oxide electrode includes perovskite structure.
- 27. (Original) The device of claim 25 wherein the metal oxide electrode includes oxide with fluorite structure.
- 28. (Original) The device of claim 23 wherein the working electrode is constructed from ceria or its solid solution doped with at least one mixed valency element.
- 29. (Original) The device of claim 28 wherein the mixed valency element is one of terbium and praseodymium.
- 30. (Canceled)
- 31. (Canceled)
